## ELECTRICAL

**Electrical Safety Standards** - To ensure the safe operation of electrical instruments, the IEC61010 has established safety standards for electrical environments. There are four categories, which are always stated with the designated voltage, for example "CAT III, 150 V" or "CAT IV, 1000 V".

**CAT I** - Applicable to instruments and equipment, which are not intended to be connected to the mains supply. Examples: low voltage electronic circuits, load circuits of bench power supplies, etc.

**CAT II** - Defines circuits which are intended for direct connection into mains sockets or similar points. Example: a device connected to a 120 V mains socket.

**CAT III** - For circuits which can be connected to the mains installation of a building. Example: 120/240 V distribution boards, busbars, or equipment permanently connected to the 3-phase power supply (e.g. electric motors).

**CAT IV** - Includes circuits which are connected directly to the source of power for a given building. There are very high levels of available energy and arc flash can occur. Example: measurements on a cable connecting the power transformer and a building (i.e. before the circuit breakers in the building).

**True Root Mean Square (TRMS)** - When measuring the value of an alternating current signal it is often necessary to convert the signal into a direct current signal of equivalent value (known as the root mean square, RMS value). This process can be quite complex and most low-cost instrumentation and signal converters carry out this conversion by filtering the signal into an average rectified value and applying a correction factor.

**Volt** - The unit by which an electromotive force or voltage is measured. The volt is a measure of electric potential. Electrical potential is a type of potential energy, and refers to the energy that could be released if electric current is allowed to flow.

**Ampere (Amp)** - Amperage or Amps provided by an electrical service is the flow rate of "electrical current" that is available.

**Ohm** - The unit of measurement for resistance. One ohm is that resistance that limits the current to one ampere when a potential of one volt exist across its terminals.

**Watt** - The unit of measurement for power. One watt equals to the work done when one joule is used per second.

**Capacitance** - The ability of two conductors separated by an insulator to store an electrical charge.

## TEMPERATURE, HUMIDITY AND MOISTURE

**Distance to Spot** - The field of view of an infrared thermometer is similar to that of a flashlight, the further the object is from the flashlight, the bigger the diameter of the beam. The further you are from your target, the larger the area of measurement spot. Optical resolution is defined by the ratio between the distance from the object being measured to the size of the object being measured (D:S). The greater the D:S ratio, the higher the optical resolution. A thermometer with a higher resolution allows you to measure smaller objects from greater distances.

**Emissivity** - Term used to express the effectiveness of a given material in emitting energy as thermal radiation.

**Relative Humidity** - Relative humidity is the amount of moisture in the air compared to what the air can "hold" at that temperature. When the air can't "hold" all the moisture, then it condenses as dew.

**Dry-Bulb Temperature (DBT)** - The dry-bulb temperature is the temperature of air measured by a thermometer freely exposed to the air but shielded from radiation and moisture. DBT is the temperature that is usually thought of as air temperature.

**Wet-Bulb Temperature (WBT)** - The wet-bulb temperature is the temperature a parcel of air would have if it were cooled to saturation (100% relative humidity) by the evaporation of water into it.

**Thermocouples (T/C)** - A temperature-measuring device consisting of two dissimilar conductors that contact each other at one or more spots, where a temperature differential is experienced by the different conductors (or semiconductors). It produces a voltage when the temperature of one of the spots differs from the reference temperature at other parts of the circuit.

**Heat index (HI)** - An index that combines air temperature and relative humidity in an attempt to determine the human-perceived equivalent temperature—how hot it feels.

**WBGT** - The wet-bulb globe temperature (WBGT) is a composite temperature used to estimate the effect of temperature, humidity, wind speed (wind chill), and visible and infrared radiation (usually sunlight) on humans.

## REFERENCE GUIDE

**Data Logger** - An electronic device that is capable of recording data over time or in relation to location either built in to the instrument or sensor or via external instruments and sensors.

**Moisture Content** - Moisture content is the quantity of water contained in a material.

### INDUSTRIAL

**Stroboscope** - Also known as a strobe, it is used to make a cyclically moving object appear to be slow-moving, or stationary. It consists of either a rotating disk with slots or holes or a lamp such as a flashtube which produces brief repetitive flashes of light. When a rotating or vibrating object is observed with the stroboscope at its vibration frequency (or a submultiple of it), it appears stationary.

**Tachometer** - An instrument measuring the rotation speed of a shaft or disk, as in a motor or other machine. The device usually displays the revolutions per minute (RPM).

**Durometer** - One of several measures of the hardness of a material. Hardness may be defined as a material's resistance to permanent indentation.

**Refractometer** - A refractometer is a laboratory or field device for the measurement of an index of refraction (refractometry).

**Anemometer** - An anemometer or windmeter is a device used for measuring wind speed.

**Lux (LX)** - The unit of illuminance and luminous emittance, measuring luminous flux per unit area. It is equal to one lumen per square metre.

**Foot-candle (FC)** - A unit of measure of the intensity of light falling on a surface equal to 1 lumen per square foot.

### GAS

**Carbon Monoxide (CO)** - is a colorless, odorless, and tasteless gas that is slightly less dense than air. It is toxic to humans when encountered in concentrations above about 35 ppm.

**Indoor Air Quality (IAQ)** - is a term which refers to the air quality within and around buildings and structures, especially as it relates to the health and comfort of building occupants. IAQ can be affected by gases (including carbon monoxide), microbial contaminants (mold, bacteria), or any mass or energy stressor that can induce adverse health conditions.

**Lower explosive limit (LEL)** - The lowest concentration (percentage) of a gas or a vapor in air capable of producing a flash of fire in presence of an ignition source (arc, flame, heat).

**Parts per million (PPM)** - Just as per cent means out of a hundred, so parts per million or ppm means out of a million. Usually describes the concentration of something in water or soil.

### WATER QUALITY

**pH** - Is the negative log of the activity of the hydrogen ion in an aqueous solution. Solutions with a pH less than 7 are said to be acidic and solutions with a pH greater than 7 are basic or alkaline. Pure water has a pH of 7.

**Oxygen Reduction Potential (ORP)** - ORP stands for oxidation-reduction potential, which is a measure, in millivolts, of the tendency of a chemical substance to oxidize or reduce another chemical substance. OXIDATION.

**Oxidation** - Oxidation is the loss of electrons or an increase in oxidation state by a molecule, atom, or ion.

**Reduction** - Reduction is the gain of electrons or a decrease in oxidation state by a molecule, atom, or ion.

**Total Dissolved Solids (TDS)** - Total Dissolved Solids is directly related to the purity of water. It is the measurement for the combined content of all inorganic and organic substances in a given volume of water, expressed in units of mg per unit volume of water (mg/L) or parts per million (ppm).

**Dissolved Oxygen (DO)** - Dissolved oxygen refers to the level of free, non-compound oxygen present in water or other liquids.

**Salinity** - Salinity is the saltiness or dissolved salt content of a body of water.

**Automatic Temperature Compensation (ATC)** - Automatic correction for the influence of temperature at the measurement source.
